Evolve OS for Mac

Turning the board into its own app that runs without claude.ai. A plan, November 5, 2026.

My take

- **The screens can come over almost as they are.** The board talks to the outside world through one doorway: its database, Claude, your calendar, Gmail, iMessages and the capture line, and file downloads. The app replaces that doorway with its own versions, so the 29,000 lines of board you already have keep working.
- **The real work is the data and the nightly tasks.** Your nine scheduled tasks (morning state, digest, lead engine, text read and the rest) all read and write the board through claude.ai. When the board moves, they have to move with it, or the board goes quiet.
- **Keep a phone version.** Today you open the board on your phone. A Mac only app would lose that. The same code can also run as a private website, the way Boos & Brews does, so the Mac app and your phone see the same board.
- **Build it next to the current board, not over it.** The claude.ai board keeps running the whole time. We switch only after a week of both running side by side.

What changes

Today, inside claude.ai	In the Mac app
Board database (the artifact store)	Supabase, a database you already use for Boos & Brews
Claude, paid by your Claude plan	Your own Anthropic API key, paid per use
Google Calendar and Gmail connectors	Your own Google sign in, through a Google Cloud project on your Evolve account
iMessages through the Claude desktop app	Read straight from Messages on your Mac, with your permission
Capture line connector	Checked when we get there. I have not looked at how it works yet.
Nine scheduled tasks write to claude.ai	Rewritten to write to the new database
Phone: the claude.ai link	The same app as a private website, behind a sign in

The build, in order

#	Step	You see
1	The doorway: the board running in a Mac window on a copy of your data, nothing live	The app opens and looks like your board
2	The database: Supabase set up, your board data copied over, a sign in lock	Your real data in the app
3	Claude: brain dump, sorting and the chat on your own key	Those features working in the app

#	Step	You see
4	Google: calendar and Gmail on your own sign in	Your week on the Board, approvals writing to Google
5	iMessages and the capture line	Texts read without the Claude desktop app
6	The nine scheduled tasks moved to the new database	Morning briefs and leads landing in the app
7	The Mac app packaged (icon, Dock, updates) and the phone website	A real app to install
8	A week of both side by side, then the switch	claude.ai board retired, or kept as a backup

What I will need from you, when we get there

- A Supabase project (a new one, or a second database on the account Boos & Brews uses).
- An Anthropic API key.
- About 15 minutes to set up a Google Cloud sign in on your Evolve account. Set as internal to your Workspace, it needs no Google review and the sign in does not expire weekly.
- Optional: an Apple Developer account ($99 a year) so the app opens without a warning. Without it, you right click and choose Open the first time.

Costs and honest notes

- **Claude:** on your own key, every brain dump, sort and chat is billed per use instead of coming out of your plan. I will measure a normal week before you switch.
- **Supabase and the phone site:** the free tiers should cover one person. I will check against your real data size in step 2.
- **Building a Mac app from here:** this session runs on Linux. The Mac app gets built on GitHub's Mac machines, and you install it from there.
- **Time:** this is the biggest thing we have built. Each step ends with something you can open and check, and nothing live changes until step 8.
