Evolve OS for Mac: the plan

November 6, 2026. Mac first. The phone comes after you say the Mac is done.

WHAT YOU ARE GETTING

A normal Mac app, like Spotify or Slack:

- You install it once. It lives in Applications and in your Dock.
- You open it with a double click. It opens in its own window, not in a browser.
- It updates itself. When I finish an improvement, the app tells you and installs it. You never download it again.
- Your board is saved online (Supabase), so nothing is lost if the Mac breaks, and the phone can use the same board later.

WHY GITHUB CAME UP

GitHub is just my workshop. A Mac app has to be put together on a Mac, and I work on a computer in the cloud, so GitHub's Mac machines assemble it for me. You should never have to go there. I will hand you the installer directly.

WHERE THINGS STAND TODAY

Done	Not done yet
The app runs your board, saves to your online database, signs you in by email link, moves your board over on first sign in, talks to Claude on your key. Tested on my cloud computer with a copy of your October 12 data.	Never opened on a real Mac. No installer you can double click. Not approved by Apple, so the Mac warns you. Does not update itself yet. Calendar and Gmail need a Google setup.

THE STEPS

Step 1. Prove it works on a real Mac (me)

Every build gets opened on one of GitHub's real Macs. It signs in, loads your board, clicks through every tab, and saves screenshots. I send you the screenshots before you install anything.

Done when: you see screenshots of the app on a real Mac with every tab open and working.

Step 2. A real installer (me, one decision from you)

A file called Evolve OS.dmg. You double click it, drag the icon to Applications, done. I deliver it to your Google Drive in a folder called Evolve OS, or straight into this chat.

> **Your decision:** Apple approval. Without it, the first open needs one trip to System Settings, Privacy & Security, Open Anyway, and self updating is less smooth. With it, it opens like any app you buy. It needs an Apple Developer account in your name: $99 a year, about 15 minutes to sign up, and Apple can take a day or two to approve it.

Done when: you have the installer and know exactly what you will see when you open it.

Step 3. Self updating (me)

The app checks for a new version when it opens and installs it with one click. After this step you never download the app again.

Done when: I send an update and it shows up in your app by itself.

Step 4. First run on your Mac (you, about 10 minutes, I walk you through it live)

- On the claude.ai board, click Download data.
- Install the app and open it.
- Type your email, click the link that arrives. Your board moves over by itself.
- Paste your Anthropic key so Claude works.

Done when: your real board is open in the app and Claude answers.

Step 5. Everything working (both of us)

I make a checklist of every feature the claude.ai board has. We go down it together on your Mac. Anything that does not work the same, I fix and send as an update.

- Every tab, the Desk, projects, tasks, money, pipeline.
- Claude: chat, briefs, sorting.
- Calendar and Gmail (needs a Google setup, I write the exact clicks when we get here).
- Your texts (read only, needs one Mac permission).
- The nightly tasks moved off claude.ai so they write to the new database.

Done when: you use the Mac app for a full week instead of the claude.ai board, and you say it is done.

Step 6. Phone (later)

Only after Step 5. A test version of the phone page is already online but parked. Nobody can see your data without your sign in. We come back to it then.

WHAT I NEED FROM YOU, IN ORDER

When	What	Time
Now	Say yes or no to this plan, and decide on Apple approval	1 minute
Step 4	Install, sign in, paste the Anthropic key	10 minutes
Step 5	Go down the checklist with me; the Google setup	Spread over the week

Nothing else. Everything not in this table is mine.
