Evolve OS for Mac: the plan

November 6, 2026, updated. Mac first. The iPhone app comes after you say the Mac is done.

WHAT YOU ARE GETTING

A normal Mac app, like Spotify or Slack:

- You install it once. It lives in Applications and in your Dock.
- You open it with a double click. It opens in its own window, not in a browser.
- It updates itself with no clicks. When I finish an improvement, it is just there the next time you look. You never download it again.
- Your board is saved online (Supabase), so nothing is lost if the Mac breaks, and the phone can use the same board later.

WHY GITHUB CAME UP

GitHub is just my workshop. A Mac app has to be put together on a Mac, and I work on a computer in the cloud, so GitHub's Mac machines assemble it for me. You should never have to go there. I will hand you the installer directly.

WHERE THINGS STAND TODAY

Done	Not done yet
The app runs your board, saves to your online database, signs you in by email link, moves your board over on first sign in, talks to Claude on your key. Tested on my cloud computer with a copy of your October 12 data.	Never opened on a real Mac. No installer you can double click. Not approved by Apple, so the Mac warns you. Does not update itself yet. Calendar and Gmail need a Google setup.

THE STEPS

Step 1. Prove it works on a real Mac (me) DONE

Every build gets opened on one of GitHub's real Macs. It signs in, loads your board, clicks through every tab, and saves screenshots. I send you the screenshots before you install anything.

Done when: you see screenshots of the app on a real Mac with every tab open and working.
Done Nov 6: all 11 tabs and Settings on an Apple chip Mac, no errors, on made up sample data. This now runs on every build.

Step 2. A real installer (me)

A file called Evolve OS.dmg. You double click it, drag the icon to Applications, done. I put it straight into this chat or your Google Drive. You never go to GitHub.

Until Apple approval is set up, the very first open needs one trip to System Settings, Privacy & Security, Open Anyway. Only once.

Done when: you have the installer and know exactly what you will see when you open it.

Step 3. Automatic updates (me)

Board changes (almost everything we build: tabs, features, wording, layouts): the app quietly checks for the newest version when it opens and every few minutes while open, and switches over when you have been idle a minute, so it never jumps while you type. Works like the claude.ai artifact does today. If a new version ever fails, it falls back to the last good one. No Apple account needed.

App changes (rare: a new Mac permission, sign in): once Apple approval is set up, these download in the background and swap in the next time you reopen the app, like Chrome. Until then, the rare one is a new installer from me.

Done when: I make a change and it shows up in your app without you doing anything.

Step 4. First run on your Mac (you, about 10 minutes, I walk you through it live)

- On the claude.ai board, click Download data.
- Install the app and open it.
- Type your email, click the link that arrives. Your board moves over by itself.
- Paste your Anthropic key so Claude works.

Done when: your real board is open in the app and Claude answers.

Step 5. Everything working (both of us)

I make a checklist of every feature the claude.ai board has. We go down it together on your Mac. Anything that does not work the same, I fix and send as an update.

- Every tab, the Desk, projects, tasks, money, pipeline.
- Claude: chat, briefs, sorting.
- Calendar and Gmail (needs a Google setup, I write the exact clicks when we get here).
- Your texts (read only, needs one Mac permission).
- The nightly tasks moved off claude.ai so they write to the new database.

Done when: you use the Mac app for a full week instead of the claude.ai board, and you say it is done.

Step 6. iPhone app (later)

Only after Step 5. A real app on your home screen with the same board, the same data and the same automatic updates. Built on GitHub's Macs, so nothing to install on your side.

- Private first: installed through Apple's TestFlight app, only you and people you invite.
- The App Store later, only if you want the public to have it.

> **Your setup, later:** an Apple Developer account, $99 a year, covers both the Mac and the iPhone. You said you will set it up once the software is further along. When we get there I will ask whether it goes under your name (faster) or Evolve Entertainment Studios (needs a free D-U-N-S business number, slower).

WHAT I NEED FROM YOU, IN ORDER

When	What	Time
Now	Nothing. Plan approved, Step 1 done.	
Step 4	Install, sign in, paste the Anthropic key	10 minutes
Step 5	Go down the checklist with me; the Google setup	Spread over the week
Step 6	Apple Developer account	About 15 minutes

Nothing else. Everything not in this table is mine.
