

The capture line

Text a number, or hold a button and talk. It lands on the board and gets sorted.

EVOLVE OS · V133 · 8 OCTOBER 2026

Once this is running you can text a number any time, or press one button on your phone and talk, and whatever you said shows up on the board within a minute. A note becomes a note. Someone who now owes you something becomes a waiting row. A calendar change becomes one tap in the approval queue, exactly like every other calendar change on this board. Nothing is ever written to your calendar without your tap, and nothing sends a message to anybody.

Why there is a worker in the middle

The board is a published page, and a published page cannot reach the open internet. It can only reach connectors you have switched on in your Claude settings. So the line is a tiny server that speaks the connector language, and you add it in settings like any other connector. That is the whole reason for the steps below.

Set aside about twenty minutes. Steps 1 to 7 are one sitting at a computer. Step 8 is on your phone.

1 Get the number

Sign in at [twilio.com](https://www.twilio.com), go to Phone Numbers, Buy a number, and buy any local number with SMS. It is about a dollar a month plus well under a cent per text.

From the Twilio console home page, copy your **Auth Token**. You need it in step 4. Keep it off paper and out of email.

2 Put the two files somewhere

Make a folder on your Mac and put `worker.js` and `wrangler.toml` in it. Both came with this document. Open Terminal and move into that folder:

```
cd ~/path/to/that/folder
```

3 Make the store it keeps things in

This is Cloudflare. It is free at this size. The first command will open a browser and ask you to log in or sign up.

```
npx wrangler login  
npx wrangler kv namespace create CAPTURES
```

That second one prints an id. Open `wrangler.toml`, find the line that says `id = "PASTE_THE_KV_ID_HERE"`, and put the id there instead.

4 Set the two secrets

These never go in a file. Each command asks you to paste a value.

```
npx wrangler secret put TWILIO_AUTH_TOKEN  
# paste the Auth Token from step 1  
  
npx wrangler secret put BOARD_KEY  
# paste a long random string you make up, 32 characters or more
```

What BOARD_KEY is

It is the password between the board and the line. You will paste it once more in step 7 and once in step 8. Keep it somewhere you can get at it, like your password manager. Anybody who has it can read your captures, so it does not go in a text message or an email.

5 Put it up

```
npx wrangler deploy
```

It prints an address ending in `.workers.dev`. That is your line. Write it down.

Open `wrangler.toml` again, find `PUBLIC_SMS_URL`, and set it to that address with `/sms` on the end. Then deploy once more so it takes:

```
npx wrangler deploy
```

The address check matters. Twilio signs the exact address it posts to, and the line compares against this value. If they do not match, every text is refused, which is the right way for it to fail.

6 Point the number at it

In Twilio, open the number you bought, scroll to Messaging, and under **A message comes in** choose Webhook, HTTP POST, and paste:

```
https://your-worker-address.workers.dev/sms
```

Save. Now text that number anything. Then check it landed:

```
curl https://your-worker-address.workers.dev/health
```

It answers with a count. If it says one, the text is on the line waiting.

Only your phone gets through

OWNER in `wrangler.toml` is set to +1 334 414 3215. A text from any other number is thrown away without being stored. If you ever change your cell, change it there and deploy again.

7 Add it to Claude as a connector

On claude.ai, go to Settings, then Connectors, then **Add custom connector**. Paste this as the address, with your own worker address and your own BOARD_KEY in it:

```
https://your-worker-address.workers.dev/mcp/YOUR_BOARD_KEY
```

FIELD	WHAT TO PUT
Name	Capture Line exactly, two words, capital C and capital L
Address	the line above, with your key on the end

The name is not cosmetic. The board looks for a connector called exactly **Capture Line** and will not find it under anything else.

Now open the board, go to Settings, and look for **The capture line**. It should say answering. If it says not answering, press Look again. If it still does not, the name or the address is off by something.

8 The button on your phone

This is the talk half. Open Shortcuts on your iPhone, make a new shortcut, and add two actions in this order.

Action one: Dictate Text

Set Stop Listening to **After Pause**. Leave the language alone.

Action two: Get Contents of URL

FIELD	VALUE
URL	<code>https://your-worker-address.workers.dev/note</code>
Method	POST
Headers	name <code>Authorization</code> , value <code>Bearer YOUR_BOARD_KEY</code>
Request Body	JSON
JSON field	name <code>text</code> , type Text, value the Dictated Text variable from action one

Name it something short like **Catch**. Then put it where your thumb already is, any or all of these:

- Settings, Action Button, Shortcut, pick it. One press from anywhere.
- Settings, Accessibility, Touch, Back Tap, Double Tap, pick it.
- Add to Home Screen from the shortcut's share menu.
- Or just say the shortcut's name to Siri.

9 Check it end to end

1. Text the number: *remember to call the rental place about the lift gate*. Inside a minute it is in the board's Inbox.
2. Text it: *move the Laurel Oaks pre pro to Thursday at 2*. It reads your calendar, works out which block you mean, and puts the move in the approval queue. Nothing is on your calendar until you tap.
3. Hold the button and say: *Marcus owes me the scout photos*. He turns up on the waiting list.

If something cannot be worked out, it is kept exactly as you said it and lands in the Inbox rather than being guessed at.

What this does and does not do

Writes your calendar	Never. It proposes, you tap.
----------------------	------------------------------

Sends a message to anybody	Never. It has no way to.
Invents a date, price or name	Never. If it cannot tell, it says so and asks.
Checks the line	Every minute while the board is open.
Where your key lives	Your Claude settings. Never in the page, so sharing the board never shares the line.
Where captures live	On the line until the board picks them up, then they are deleted from it.

When something is off

WHAT YOU SEE	WHAT IT IS
Settings says not answering	The connector is missing, off, or not named exactly Capture Line.
Texts never arrive	PUBLIC_SMS_URL does not match what Twilio posts to, or the text came from a number that is not OWNER.
The shortcut errors	The Authorization header is wrong. It is the word Bearer, a space, then the key.
Answered in a shape it cannot read	The worker was changed. Put the original worker.js back and deploy.
Nothing at all	<code>curl https://your-worker-address.workers.dev/health</code> tells you whether the line itself is up.

One thing I could not test

The connector does not exist until you create it in step 7, so no real call to it was possible from here. Everything else is tested: the worker passes its own suite including Twilio's published signature check, and the board passes its full regression suite against this build. The first live call is yours.
