

Evolve OS, the master list

8 October 2026. Everything still open from this conversation, the Assistant Brain plan, the Night Lead Engine status, the second audit and the Logiconova agreement. Live board: V147 at claude.ai/artifact/KmwsKLGeZxU6vG284njSfR.

1. Where things stand

Build	What it did	State
V134 to V136	Every project and deliverable date that has passed says carried. Invoices keep late and past due.	Live
V137	Audit fixes: reassign no longer drags back a block you moved in Google, Meet links, newest email in a thread, chip memory, refresh after undo.	Live
V138	The bin. Every delete is kept 30 days and can be put back.	Live
V139	Approve holds a change when Google cannot confirm it is safe.	Live
V140	The last overdue, slipped, missed and failed wording trimmed.	Live
V141, V142	Inbox sweeps read up to 75 threads, lighter loading, 114 unused style rules removed.	Live
V143	Critical path on project timelines.	Live
V144, V145	Client and project totals, one money rule everywhere, leads linked to clients, booked.	Live
V146	The plan: costs, payment calendar, when the next project has to land, wins and reach outs a week, the Home strip.	Live
V147	Work Orders with Logiconova: start payment, your review window, balance, warranty. Money owed to them on the payment calendar and in the plan. A Needs You line when a review window is closing.	Live

Every build is in the repo with its patch and its tests, and each one rebuilds byte for byte from the one before.

2. Mistakes found in this session

All were caught before anything went live, except where it says so.

What	What happened
Payment date field	The new calendar read a payment's date from the wrong field. Caught in testing, fixed before V146 went live.
"1 win every 1 weeks"	Wording bug in the plan. Fixed before V146 went live.
The bin and record ids	The bin first dropped a record's own id on restore. Fixed before V138 went live.
Style cleanup	The first remover could mix a comment into a selector. Fixed, then every element on 19 screens was proved identical.
The V68 late bug	Fixed in the code in V134. The second audit is right that your live deliverables list is empty, so you had never actually seen it on your board. The fix still matters once deliverables exist.
The ledger in your Project	I updated the ledger and handoff in the repo, not the copy in your Claude Project. The Brain plan was written from the Project copy, which is why it says the ledger stops at V133. You need to upload the new one (section 4).

What	What happened
Plain summaries	PDF summaries stopped after the first audit. V138 to V147 had none until this list.
Pull request	None was opened. The repo had no main branch, so there is nothing to merge into. The work is safe on its branch.

3. Things that clash between the plans

Clash	Why it matters	Suggestion
Another session plans to publish its board work as "V134"	The Lead Engine's Prospects lens was planned against V133. The board is V146 now, V147 next.	Any session building the board starts from the live version and the repo ledger. The publish tool already forces a read of the live page, so nothing gets silently overwritten.
Personal costs in the shared board	You chose to keep them there. The Brain plan's privacy rule says personal detail never goes where Gavin or Grace can see it, and the board is open by link.	Decide who can open the board (Brain plan section 8). Until then this is a known exposure.
Two homes for bills	The Brain plan puts bills and renewals in a new dates list. V146 put recurring costs in costs.	Keep both: costs are what repeats, with an amount. Dates are one off deadlines. The brain reads costs instead of copying them.
Projects stored twice	16 of 21 projects exist as two records, laurel-oaks and laureloaks. A delete from the board removes only one, so the twin comes back. The same is true in the bin.	Board fix: always write one name, merge the twins, then delete the leftovers. First on my list (section 7).

4. Quick things only you can do

In order of what each one unlocks.

#	Do this	Time	Unlocks
1	Turn on Automatically approve on the Close the day nudge task.	One flip	Your days get closed again. Nothing has been closed since 29 September.
2	Upload the new ledger and handoff to your Claude Project: evolve-os/docs/EVOLVE_BUILD_LEDGER.md and HANDOFF.md in the repo.	2 minutes	Every other session sees V134 to V147.
3	On Money, add your costs, business and personal, then Set the numbers.	15 minutes	The plan, the payment calendar and the Home strip start working.
4	Say whether the Logiconova agreement is signed by both sides. The copy you sent has blank signature lines.	1 minute	Work Orders start counting from a real date.
5	Answer the three people waiting: Auburn Public Works (37 days), the Mumbai developer call time (18 days), Cheryl Bullard and Mr. Abell's signed agreement (13 days).	A sitting	The community service morning, the Logiconova call, that agreement.
6	Lead engine: say the word to switch it on, remove Spotify, ClickUp, Canva, higgsfield, Zoom and Tally from its task, confirm the 33 committee flags, pick the 10 leads for the mock test, give your weekly usage reset day, approve the call kit scripts.	A sitting	The cold campaign starts.

#	Do this	Time	Unlocks
7	Deploy the capture line worker with me. Twilio approved the campaign on 7 October.	20 minutes	Texts and voice notes land on the board without the Mac.
8	Decide on a Mac that stays awake.	Your call	Every text thread read every hour.

5. Decisions that are yours

Decision	Where it comes from
The nine decisions in the Brain plan, section 8: where tasks live, how much the scheduler may do alone, whether it may send on your yes, how often it reads, which text threads, holds on the calendar, who can open the board, when the morning text lands, the Night Lead Engine on or off.	Assistant Brain plan
Is the \$5K by August 31 target still real? The daily planner still enforces it and your business facts file marks it stale.	Business facts file
A main branch for the repo, so changes can go through pull requests.	Repo

6. Words waiting on you

Where	Words
V134 to V136	Five lines I worded: "Brand film cut, carried 9 days" with "Acme is waiting. Move it or move the date.", "3 things for Acme are carried", "One other thing on it is already carried behind this.", "The next move, carried 3 days", and the Owed row ending in "9 days".
V145	"No client yet" in the lead's client list.
Brain plan B11	The morning text, shift alert, hold prefix, does not fit, asks, and every new board label it adds.

7. Board work still to build

#	What	Why
1	Fix projects stored twice: one name for every write, merge the 16 twins, delete leftovers, and make delete and the bin cover both.	Two writers can each win a different copy. Deletes do not stick.
2	Lead Engine board work: Prospects lens, outcome buttons, promotion row, Lead Engine panel, two Today groups.	The other session's plan, now built on V147.
3	A won or replied prospect becomes a pipeline lead marked cold.	The plan's cold win rate switches from your guess to real numbers only through the pipeline.
4	Logicnova fees count as project cost.	Margin per site is wrong without what you pay Mumbai.
5	A won lead with no invoice offers a draft deposit invoice, 50/50 per the rate card.	Booked work stays invisible on the payment calendar until it is invoiced.
6	Brain plan Publish 1 and 2: time needed and real time on tasks, the brain section in Settings, owed, holds, dates, prep, replaced decisions.	The board side of the scheduler.
7	Smaller: one save that can overwrite a record on an odd error, a raw write on the queue, two time zone details in the time shift code (needs your OK to touch it), 51 maybe unused styles, records that only grow.	Housekeeping. None is hurting anything today.

8. Ideas that need more thought

These are yours, and each needs input before it can be built properly.

Idea	What exists now	What I need from you
Project turnaround schedule: you on design and client meetings, Logicnova on the back end, several sites at once	V147 tracks each Work Order's dates and money. The rate card says a Starter or Growth site turns in 3 to 5 weeks.	How many hours your part of a site takes, how many client meetings a site needs, how many sites you can run at once, and how long Logicnova really takes (the first Work Order will tell us).
How many projects to land a month	V146 works it out from money: what you need to land by when.	Your capacity, so the board can say: money says 4, capacity says 3, here is the gap. The levers are price, retainers (the rate card's \$20K a month lever) or more help.
The cold campaign funnel: scrape, mock a hero, reach out, call, close	The engine has 85 leads that pass every gate. The plan counts reach outs a week from your guess.	The steps you want tracked, the time a mock really takes (rate card says 30 to 60 minutes), and whether mocks go on your calendar. At 16 reach outs a week, 85 leads is about 5 weeks of supply.
The daily schedule brain	The Brain plan is the full design. The board has the Home strip, Needs You and the approval queue.	The section 8 decisions. Then it is built in the plan's phases.
Real money in	Cash on hand is typed in by you. No bank, QuickBooks or Relay connector exists.	Whether a weekly cash on hand prompt is enough, or a bank link is worth building outside the board.
Gavin's overhead map	Not found in Drive or ClickUp.	Where it lives, or just type the costs in on Money.
Your business facts	Overhead, win rate, average project, capacity and turnaround are all blank in the facts file every strategy skill reads.	Once your costs are in, I can copy the totals across, with your OK.

9. What it still cannot do

Phone calls and in person conversations, Instagram and Facebook messages, the bank, texts while the Mac sleeps, and anything instant: the readers run once an hour at most. The Capture Line and iMessage connections have never been seen working from this session.
